

ASP.NET Core MVC Architecture Notes

Chapter 1: The Model-View-Controller (MVC) Pattern

Model: Represents application data and business rules.

View: Renders user interface using Razor syntax (.cshtml).

Controller: Handles incoming HTTP requests and updates Model/View.

Chapter 2: Dependency Injection in ASP.NET Core

ASP.NET Core has built-in DI for loose coupling and testability.

Common service lifetimes: Transient, Scoped, and Singleton.

Chapter 3: Model Validation in ASP.NET Core

Use DataAnnotations and ValidateNever attributes to control validation.
